

## **Inline Design Group, INC Environmental/LEED Statement**

Inline Design Group prioritizes environmental awareness and understands the ongoing need to reduce our carbon footprint. We are always looking for better ways to ensure products are environmentally friendly from our manufacturing processes to offices and shops we work in.

Stainless steel is a green, sustainable product. It is 100% recyclable, as it is not coated with harmful materials; and it does not produce toxic runoff. Companies and individuals can make a huge difference by simply choosing stainless steel over non-recyclable materials.

In the production of stainless steel, scrap metal may serve as a primary raw material, with up to 70% of the product coming from recycled sources. Increased efficiency in process technology has also reduced the amount of energy required to manufacture stainless steel.

Even if stainless steel is not recycled and finds its way to a landfill or disposal site, it will have no detrimental effect to the soil or groundwater.

Stainless Steel is the preferred material for green building throughout the world, because its impact on the environment is minimal, when compared to other materials. Furthermore, stainless steel's life cycle increases significantly as it used and recycled.
